Professional Summary

Computer Science graduate with hands-on DevOps experience across Linux server administration, Docker containerization, AWS cloud infrastructure, and CI/CD automation. Comfortable managing services, configuring environments, monitoring system health, and deploying applications end-to-end. Experienced in building reliable, maintainable infrastructure through real projects with a strong bias towards automation and clean operational practices.

Skills

- Cloud & Infrastructure:** AWS (EC2, S3, CloudFront), Linux server administration, SSH, environment configuration
- Containers & Orchestration:** Docker, Docker Compose, containerized service deployment and maintenance
- CI/CD & Automation:** GitHub Actions (pipeline setup, health checks, config validation), Bash scripting, package management
- Monitoring & Observability:** Prometheus, Grafana (metrics collection, dashboard setup, alerting)
- Version Control:** Git, GitHub (branching, pull requests, workflow automation)
- Networking & Security:** SSH access control, firewall basics, JWT authentication, role-based permissions
- Programming:** Python, Java, JavaScript, Bash
- Soft Skills:** Structured problem-solving, documentation, self-directed learning, attention to detail

Education

Lourdes Matha College of Science and Technology – B.Tech in Computer Science Engineering, 2025 CGPA: 7/10

Internship

Full-Stack Java Development Intern – Kompetenzen Technologies Feb 2026 – Apr 2026

- Managed the full deployment lifecycle of a Spring Boot application — configuring the server environment, handling dependencies, and ensuring stable service operation.
- Implemented JWT authentication and role-based access control; documented system architecture, API endpoints, and deployment procedures for team use.

Projects

Dockerized Monitoring Stack: Prometheus, Grafana, Docker, GitHub Actions May 2026

- Built a fully containerized monitoring pipeline using Docker Compose, collecting and visualizing real-time system health metrics across services via Grafana dashboards.
- Automated configuration validation and service health checks using GitHub Actions CI/CD, ensuring every change was verified before deployment and catching misconfigurations early.

AWS EC2 Break-and-Fix Troubleshooting Labs: AWS EC2, Linux, Bash 2026

- Designed and resolved simulated production incidents on AWS EC2 including service failures, misconfigured permissions, and database recovery using structured, log-driven root cause analysis.
- Built operational runbooks documenting diagnosis steps and fixes, forming the foundation for the AI-assisted log summarization pipeline.

AI-Powered Log Summarization Pipeline: Python, LangChain, FAISS, AWS 2026

- Built a RAG pipeline to automate incident triage by retrieving similar past incidents from a vector database and surfacing likely root causes from server logs integrated with AWS EC2 workflows.
- Reduced manual log-scanning effort during incident response by turning ad hoc diagnosis into a structured, semi-automated first pass.

Self-Hosted Services : Docker, Linux, Nextcloud, Whoogle 2023 – 2026

- Deployed and maintained self-hosted Whoogle search and Nextcloud home server using Docker handling configuration, access control, updates, and ongoing troubleshooting for always-on availability.
- Managed networking, storage, and security settings independently, developing strong habits around service reliability and operational hygiene.

Android ROM Development: Linux, Git, AWS EC2, Fastboot, AOSP May 2024

- Compiled a custom Android ROM from AOSP source on an AWS EC2 cloud build server, managing the Linux build environment, Git version control, and Fastboot-based device flashing.
